## POWER TRIODE

- \*\* Subject to wide variations depending on the impedance of the plate circuit. High-impedance plate circuits require more grid current and driving power to obtain the desired output. Low-impedance plate circuits need less grid current and driving power, but plate-circuit efficiency is sacrificed. The driving stage should have a tank circuit of good regulation and should be capable of supplying considerably more than the required driving power.
- At crest of audio-frequency cycle with modulation factor of 1.0.
- Carrier power of driver modulated 100%.
- Modulation essentially negative may be used if the positive peak of the audio-frequency envelope does not exceed 115% of the carrier conditions.

Data on operating frequencies for the 9C27 are given on the sheet TRANS. TUBE RATINGS vs FREQUENCY.
